**Test Organism Abbreviations:**

Cerio = Ceriodaphnia dubia  
Pimeph = Pimephales promelas  
Selanas = Selanastrum capricornutum  
Raphi = Raphidocelis subcapitata  
x-ALL-x = Water chemistry data associated with all organisms.

**Suspect Toxicant Abbreviations:**

Inconcl. = Inconclusive  
Met act pest = Metabolically activated pesticides  
Non-pol org = Non-polar organics

## 2001-2002 Aquatic Toxicity Study Data Key

Test Conclusion Codes:	
Code	Test Conclusions
C8-3	Toxicity was not removed by the C8 column.
C8-4	Toxicity was removed by the C8 column.
DO-1	Data suggest that low DO could be the cause of toxicity observed in the samples..
DO-2	Data suggest that low DO was not responsible for the toxicity observed in the samples.
EDT-1	High concentration of EDTA is the cause of toxicity in the control sample.
EDT-3	Mortality in high concentration of EDTA ensures that the correct concentration of EDTA was used. The high mortality does not affect the test.
ELU-1	Toxicity was detected; however, mortality could be due to the 2X eluate.
ELU-2	Toxicity was detected; however, mortality could be due to the 3X eluate.
ES-1	No toxicity detected.
ES-3	Toxicity detected.
ES-4	Toxicity detected; due to low initial DO of sample, an extended aeration TIE was performed instead of a chronic toxicity screen.
ES-7	Toxicity was lost due to an extended hold time. Data is inconclusive.
LC-1	Artifactual toxicity PRESENT in control blanks.
LC-4	No artifactual toxicity present in control blanks.
M-1	Absence in mortality suggests that metals contributed to the toxicity in the sample.
M-5	Data suggest that toxicity was due to a metal.
M-6	Data suggest that toxicity was not due to a metal.
M-7	Data suggest that toxicity was partially due to a metal.
M-8	Decrease in mortality suggests that metals contributed to the toxicity of the sample.
MAP-1	Absence in mortality suggests that the toxicity was at least in part due to a metabolically activated pesticide.
MAP-12	Toxicity was detected suggesting that a non-polar organic chemical was partially responsible.
MAP-13	Toxicity was detected suggesting that a non-polar organic chemical was responsible.
MAP-14	Toxicity was not detected suggesting that a non-polar organic chemical was not responsible.
MAP-3	Delay in mortality suggests that the toxicity was at least in part due to a metabolically activated pesticide.
S-1	Absence in toxicity suggests that surfactants were partially responsible.
S-3	Data suggest that surfactants were partially responsible.
S-4	Data suggest that surfactants were responsible.
S-9	Toxicity suggests that surfactants were not responsible.
STS-1	Mortality due to high concentration of STS.

**Test Organism Abbreviations:**

Cerio = Ceriodaphnia dubia  
Pimeph = Pimephales promelas  
Selanas = Selanastrum capricornutum  
Raphi = Raphidocelis subcapitata  
x-ALL-x = Water chemistry data associated with all organisms.

**Suspect Toxicant Abbreviations:**

Inconcl. = Inconclusive  
Met act pest = Metabolically activated pesticides  
Non-pol org = Non-polar organics

## 2002-2003 Aquatic Toxicity Study Data Key

Test Conclusion Codes:	
Code	Test Conclusions
C8-3	Toxicity was not removed by the C8 column.
C8-4	Toxicity was removed by the C8 column.
CLX-1	Low cell counts indicates Chelex resin may be releasing toxic compounds or glassware may be contaminated.
EDT-2	High mortality may be due to high concentration of EDTA.
EDT-3	Mortality in high concentration of EDTA ensures that the correct concentration of EDTA was used. The high mortality does not affect the test.
EDT-4	Sample is still toxic with addition of EDTA; therefore, toxicity is not due to metals.
ELU-1	Toxicity was detected; however, mortality could be due to the 2X eluate.
ELU-2	Toxicity was detected; however, mortality could be due to the 3X eluate.
ES-1	No toxicity detected.
ES-3	Toxicity detected.
ES-7	Toxicity was lost due to an extended hold time. Data is inconclusive.
LC-1	Artifactual toxicity PRESENT in control blanks.
LC-2	Control DID NOT meet all EPA criteria for test acceptability.
LC-4	No artifactual toxicity present in control blanks.
LC-5	No artifactual toxicity resulting from manipulations.
M-10	Significant decrease in mortality relative to C8 Rinsate suggests that toxicity is, in part, due to a metal.
M-11	Significant delay in mortality relative to ambient sample suggests that a metal may, in part, be responsible for toxicity.
M-12	Significant increase in cell counts relative to ambient water suggests that a metal may, in part, be responsible for toxicity.
M-13	The absence of a reduction in mortality suggests that the toxicity was not due to a metal.
M-2	Data suggest that a metal contributed to toxicity.
M-6	Data suggest that toxicity was not due to a metal.
M-9	Significant decrease in mortality relative to ambient sample suggests that a metal may, in part, be responsible for toxicity.
MAP-10	Significant decrease in mortality relative to ambient sample suggests that a non-polar organic compound may, in part, be responsible for toxicity.
MAP-11	Significant increase in cell counts relative to ambient water suggests a non-polar organic compound may, in part, be responsible because less of an improvement.
MAP-12	Toxicity was detected suggesting that a non-polar organic chemical was partially responsible.
MAP-13	Toxicity was detected suggesting that a non-polar organic chemical was responsible.
MAP-5	Sample is still toxic with addition of PBO; therefore, toxicity is not due to metabolically active compounds.
MAP-9	Significant decrease in mortality relative to ambient sample suggests that a non-polar organic compound may be responsible for toxicity.
NXS-1	Sample is still toxic with the addition of Nexus; therefore, toxicity is not due to non-polar organic compounds.
S-1	Absence in toxicity suggests that surfactants were partially responsible.
S-10	Toxicity suggests that surfactants were partially responsible.
S-2	Data suggest that surfactants were not responsible.
S-3	Data suggest that surfactants were partially responsible.
S-5	Decrease in toxicity suggests that surfactants were partially responsible.
S-6	Sample is still toxic with air stripping; therefore, toxicity is not due to surfactants.
S-7	Significant decrease in mortality relative to ambient sample suggests that a surfactant may, in part, be responsible for toxicity.
S-8	Significant delay in mortality relative to ambient sample suggests that a surfactant may, in part, be responsible for toxicity.
S-9	Toxicity suggests that surfactants were not responsible.
STS-2	Mortality may be due to high concentration of STS.

## 2002-2003 Aquatic Toxicity Study Data Key

Test Conclusion Codes:	
Code	Test Conclusions
STS-3	Sample is still toxic with the addition of STS; therefore, toxicity is not due to metals.
TU-1	Acute toxicity detected down to a 100% dilution, suggesting that approximately 1 TU is present in the sample.
TU-2	Acute toxicity detected down to a 25% dilution, suggesting that a minimum of 4 TU's are present in the sample.
TU-3	Acute toxicity detected down to a 50% dilution, suggesting that a minimum of 2 TU's are present in the sample.
TX-1	Second toxicant(s) may be present in this fraction.
TX-2	Toxicant(s) absent in these fractions.
TX-3	Toxicant(s) may be present in these fractions.
TX-4	Toxicant(s) presence/absence unknown.
TX-5	Toxicant(s) present in these fractions.
